

The forty participants in the Saskatoon Nature Society fall count on September 12, 2026 found 151 species, just below the long-term average of 153. Water levels were at their highest in several years. White-faced Ibis was seen for the first time, Red Crossbill for the first time since 2004 and Say’s Phoebe for the first time since 2013.

Low counts relative to the long-term average were recorded for Bufflehead (14% of the LTA), Killdeer (18%), Horned Lark (25%, has been declining for four years), Gray Catbird (20%), Brown Thrasher (20%) and Lapland Longspur (4%). The Black-billed Magpie count was 67% of the LTA, but this masks what has been happening in the rural sectors, where the decline is substantial.

While the urban counts have been in a general uptrend for 10 years, the rural counts have gyrated and since 2020 have collapsed from almost 400 to 50 currently. Year to year changes and long-term trends in the count for a species can be caused by a variety of factors including disease, shifting migration schedules due to climate change, habitat loss and a myriad of other factors. If the low rural magpie count this year was due to disease one might expect the rural American Crow count to be similarly low, but in fact it rose 300% from the previous year.

Species counts substantially above the LTA include Snow Goose (610%), Cackling Goose (424%), Ruddy Duck (482%), Franklin’s Gull (385%), and White-breasted Nuthatch (455%). Two Finch species were present in unprecedented numbers: 54 Red Crossbills were counted compared to a total of three in the prior history of the count and Pine Siskin set a new count record (637%).

Thank you to all who participated in the count this year. We hope you will join us again on future counts.
